Compact Steam Boilers

Rapid Start-Up
Safe in Operation
AB&CO · TT BOILERS

The boiler maker AB&CO · TT BOILERS LTD. have since the middle sixties produced industrial boilers and heaters for thermal fluid (hot thermal oil), steam, water and recuperative type (heat recovery).

The boilers are famous for their high reliability and efficiencies, but also for the customised design when required by the special circumstances.

TT BOILERS have a service organisation dealing with service and delivery spare parts throughout the world. A staff of field engineers offers start-up, commissioning, repair, scheduled overhauls etc.

TT BOILERS joined the AB&CO company group in 2000 and in this set-up the Danish owned company group AB&CO · TT BOILERS today design, manufacture and deliver a wide range of customised thermal solution within process heating and heat recovery – the key products being small and medium sized industrial boilers and special heat exchanger for process air, exhaust gas and other special fluids.

INTRODUCTION

Opposite conventional steam boilers, the water in the steam generators contains a very small water and steam volume (content of the pressure vessel). This gives a lot of advantages:

- Easy to operate - normally no requirement for boiler authorisation
- Rapid start-up and establishing full steam pressure
- Compact and easy to adapt in the existing machinery arrangement
- Price attractive - especially at low steam rates.
- Approved for industry, marine and offshore.

The steam generators are delivered in the range 150 - 5,000 kg/h steam at 1 barg all the way up to 190 barg (for special applications). These complete units are easy to install and does not require any special foundation, but can be place directly on concrete floor. Rapid start-up down to 2 - 3 minutes on the smaller

CONSTRUCTION

The steam generators heaters are made with coils made of seamless tubes, where the feed water is preheated and evaporated during the flow through these. The heat is transferred to the water/steam mixture as radiant heat in the combustion chamber, where the inner cylindrical tube coil and a flat tube coil forms the chamber wall and the bottom respectively. Consequently refractory concrete is avoided. The combustion gasses are hereafter cooled in the outer convection part, as the gasses pass the space between the two tube coils. The thermal design ensures a modest volume of steam relative to the size of the heater, and allows unlimited thermal expansion due to the high temperatures. All TT Boilers steam generators and steam boilers are designed and equipped according to German TRD boiler regulations and Danish AT boiler regulations (and corresponding ratified EN-norms).

DT steam generators are made in carbon steel and different grades of stainless steel.

As standard the steam boilers are provided by international recognized and only high quality burner brands - for natural gas, light fuel oil, heavy fuel oil and combinations (dual fuel). Demands for special burner designs can be meet and adapted in the heater design. All boilers are carefully checked, controlled and function tested prior to dispatch from the workshop.

Beside the standard execution the DT boiler can be delivered in e.g. following variations:

- High pressure – up to 190 barg / 350°C
- All stainless steel - for production of clean steam
- Complete skid-mounted steam plants
- Mobile steam - build in a container or on a trailer.

**TABLE VALUES · Presumptions:**
The below stated values for heat capacity and fuel consumptions are based on 60°C feed water temperature, 5 bar steam pressure, Abt. 90% efficiency and normal European quality light fuel oil (Hi=42.300 kJ/kg) and natural gas (Hi=39.600 kJ/Nm³).
